Arithmatic mean:→

→ If a, b & c are in A.P then $(b-a) = (c-b)$

So $\boxed{b = \frac{a+c}{2}}$, called arithmatic mean

Common term:→

→ If there are two series,

$a_1, a_2, a_3 \cdots\cdots\cdots$ (difference $= d_1$)

$b_1, b_2, b_3 \cdots\cdots\cdots$ (difference $= d_2$)

If a = first common term of two series.

d = lcm of d_1 & d_2

then $\boxed{t_n = a + (n-1)d}$

Application:→

→ $x, A_1, A_2, A_3, \cdots\cdots\cdots A_n, y$ are in A.P, then

$$\boxed{A_1 + A_2 + A_3 + \cdots\cdots + A_n = \frac{n(x+y)}{2}}$$

→ in A.P, if sum of n consecutive numbers is known then mid number = $\frac{\text{sum}}{n}$ (n should be always odd number).

Geometric progression (G.P) :→

Series → $(a, ar, ar^2, ar^3 \ldots\ldots)$

→ If three numbers are in GP then you have to take

$$\left(\frac{a}{r}, a, ar\right)$$

Subrasit Sir

→ n^{th} term, $\boxed{t_n = ar^{n-1}}$

→ Sum of n terms,

$S_n = \frac{a(1-r^n)}{(1-r)}$, $\lvert r\rvert < 1$
$S_n = \frac{a(r^n-1)}{r-1}$, $\lvert r\rvert > 1$
$S_\infty = \frac{a}{1-r}$, $\lvert r\rvert < 1$

→ $\boxed{r = \frac{a_2}{a_1} = \frac{a_3}{a_2} = \frac{a_{n+1}}{a_n}}$, called common ratio.

Geometric mean :→

→ If a, b, c are in G.P then $\frac{b}{a} = \frac{c}{b}$

$\Rightarrow \boxed{b^2 = ac}$ or $\boxed{b = \sqrt{ac}}$, called geometric mean.

Application :→

→ $x + xx + xxx + \cdots$ upto n terms $= \frac{x}{9}\left[\frac{10}{9}(10^n - 1) - n\right]$

→ Total apple = (Remaining apple $\times 2^n$) + $(2^n - 1)$

Harmonic progression :→

Series → $\frac{1}{3}, \frac{1}{6}, \frac{1}{9}, \frac{1}{12}, \frac{1}{15}$ ....

→ If a, H, b are in H.P then $\boxed{H = \frac{2ab}{a+b}}$, called Harmonic mean

→ $\boxed{A.M \times H.M = (G.M)^2}$

Subrasit sir

5. The product of all factors of composite number N = $N^{n/2}$ (where n is the total no of factors of N)
6. Total no of odd factors = $(p+1)(q+1)(r+1)(s+1)\ldots$ (where p, q, r, s ... are powers on odd numbers)
7. No of even factors = Total no of factors − Total no of odd factors

* UNIT DIGIT CONCEPT :→

→ 0, 1, 5, 6 — No change

→ $4^{even} = 6$ (unit digit) , $9^{even} = 1$ (u.d)

$4^{odd} = 4$ (unit digit) , $9^{odd} = 9$ (u.d)

→ $2^{4n} = 8^{4n} = 6$ (u.d)

$3^{4n} = 7^{4n} = 1$ (u.d)

→ Divide the power on them (number) by '4' and find out the remainder and if remainder is

1 → Number will be itself as ~~remainder~~ unit digit (or) multiply that number (digit only) with 1.

2 → multiply that number (only digit) two times

3 → multiply that number (only digit) three times

0(4) → multiply that number (only digit) four times.

Between 1-100 ⇒ 25 prime numbers

100 - 200 ⇒ 21 prime numbers

200 - 300 ⇒ 16 prime numbers

300 - 400 ⇒ 16 prime numbers

400 - 500 ⇒ 17 prime numbers

* Remainder theorem :→ $\boxed{\text{Subrajit Sir}}$

→ Divident = Divisor x quotient + Remainder

→ $\frac{(a-1)^n}{a}$, If n is even then remainder = 1
If n is odd then remainder = (a-1) {Numerator}

(or) $\frac{a^n}{(a+1)}$, If n is even then remainder = 1
If n is odd then remainder = a {Numerator}

→ $\frac{(a+1)^n}{a}$, Remainder is always 1, wheather n is even or odd.

→ $x^n + y^n$ (n is positive integer
x, y are co-prime number)

→ Having no even factor

→ If n is odd then (x+y) will divide it.

→ $x^n - y^n$ (n is positive integer, x, y are co-prime number)

↳ If n is odd then $x-y$ will divide it.

↳ If n is even then both $(x+y)$ & $(x-y)$ will divide it.

→ If a polynomial $f(x)$ is divided by $(x+a)$ then remainder is $f(-a)$.

→ If a polynomial $f(x)$ is divided by $(x-a)$ then $f(a)$ will be remainder.

→ If a polynomial $f(x)$ is divided by $(ax+b)$ then the remainder is $f\left(\frac{-b}{a}\right)$.

→ $\boxed{R_3 = R_1 + R_2 - \text{Divisor} \,//\, \text{Divisor} = R_1 + R_2 - R_3}$

→ Number = (Lcm of Divisors — Difference of Divisors and remainders)

→ If there is 'xyxyxy' type number then it is divisible by 7, 13 and 7×13 (both).

→ If there is 'xyoxy', 'xyzxyz' or 'xxxxxx' type number then it is divisible by 7, 11, & 13, and also by 1001 (7×11×13)

Subrajit sir

HCF & LCM :→

$$\begin{aligned} a &= H \times x \\ b &= H \times y \end{aligned} \quad \left\{ \begin{aligned} &a, b \to \text{composite numbers} \\ &x, y \to \text{prime numbers} \end{aligned} \right\}$$

→ $H.C.F = H$

$L.C.M = H \times x \times y$

$= H.C.F \times (x \times y)$

→ $a \times b = LCM \times HCF$ {product of two numbers is equal to product of their HCF & LCM}

→ $a+b = H(x+y)$

→ $x+y = \frac{a+b}{H}$

→ $x \times y = \frac{a \times b}{H^2}$

→ $x \times y = \frac{LCM}{HCF}$

→ $\boxed{\frac{a+b}{LCM} = \frac{H(x+y)}{H(x \times y)} = \frac{(x+y)}{xy}}$

→ LCM of fractions = $\frac{\text{LCM of Numerator}}{\text{HCF of Denominator}}$

→ HCF of Fractions = $\frac{\text{HCF of Numerator}}{\text{LCM of Denominator}}$

→ Number = (LCM of Divisors − Difference of Divisors & Remainder)

* Indices and Surds :→

→ $(xy)^m = x^m \times y^m$ (And viceversa)

→ $\left(\frac{x}{y}\right)^m = \frac{x^m}{y^m}$ (And viceversa)

→ $x^m \times x^n = x^{m+n}$ (And viceversa)

→ $\frac{x^m}{x^n} = x^{m-n}$ (And viceversa)

→ $(\sqrt[n]{x})^m = \sqrt[n]{x^m}$ (And viceversa)

$\rightarrow ((x^m)^n)^p = x^{m \times n \times p}$ {Bracket must be there}

$\rightarrow x^{m^{n^p}} = x^{m^{n \times n \times n \ldots\ldots p \text{ times}}} = x^{m \times m \times m \ldots\ldots n^p \text{ times}}$ (No Bracket)

$\rightarrow \boxed{\text{So } ((x^m)^n)^p \neq x^{m^{n^p}}}$

Subrasit Sir

$\rightarrow x^0 = 1 \ (x \neq 0)$

$\rightarrow$ If $x^m = y$ then $x = y^{1/m}$ (And viceversa)

$\rightarrow$ If $x^{1/m} = y$ then $x = y^m$ (And viceversa)

$\rightarrow$ If $a^x = b^y$ then It is possible when $x = y = 0$

$\rightarrow$ If $a^x = b^y$ then $a = b^{y/x}$ or $b = a^{x/y}$

$\rightarrow$ If $a^x = a^y$ then $x = y$

$\rightarrow a^n = \frac{1}{a^{-n}}$ or $a^{-n} = \frac{1}{a^n}$ (And viceversa)

$\rightarrow$ If $(N_1)^p = (N_2)^q = (N_1 N_2)^{-z}$ then $\frac{1}{p} + \frac{1}{q} + \frac{1}{z} = 0$

or If $(N_1)^{-p} = (N_2)^{-q} = (N_1 N_2)^{z}$ then $\frac{1}{p} + \frac{1}{q} + \frac{1}{z} = 0$

$\rightarrow$ If $xy = 0$ then $x = 0$ or $y = 0$

$\rightarrow$ If $x^2 + y^2 = 0$ and x, y are real numbers then $x = 0$ or $y = 0$

$\rightarrow$ If $x + y = K$ then maximum value of xy is when $x = y$

* Surds :-

$\rightarrow \sqrt{a + \sqrt{a + \sqrt{a + \sqrt{a}}}} \ldots\ldots \infty = \frac{\sqrt{4a+1} + 1}{2}$ $(= x \text{ (say)})$

$\rightarrow \sqrt{a - \sqrt{a - \sqrt{a - \sqrt{a}}}} \ldots\ldots \infty = \frac{\sqrt{4a+1} - 1}{2}$ $\{= y \text{ (say)}\}$

(Relation between them is 1 i.e $(x - y) = 1$)
